

GH Trust Loan Platform

Ready to launch — no wallet required

Product Owner Brief · August 2026

The GH Trust loan platform is **built, tested, and ready for your team to start using**. Customers can apply for loans. Your staff can review, approve, and disburse — all in one place. **You do not need wallet or virtual account integration to go live with loans.**

Bottom line: Loans work end-to-end today. Wallet funding is a separate feature we can add later. You can deploy now and start processing real applications immediately.

What this means for the business

- **Start earning from lending now** — four loan products are ready (Business, Payday, Study, Asset).
- **No waiting on payment partners** — disbursement goes directly to the customer's bank account, the same way many MFIs operate today.
- **Your team stays in control** — configurable approval steps, document checks, and full audit trail on every application.
- **Customers get a smooth experience** — apply on the app, upload documents, track status, and see active loans after disbursement.

What's ready today

Capability	Status	What it means for you
------------	--------	-----------------------

Loan products	Ready	Business, Payday, Study, and Asset loans — rates, fees, and document lists already set up. You can turn products on or off anytime.
Customer applications	Ready	Customers browse products, fill forms step-by-step, upload documents, and submit — all from the app.
Admin review portal	Ready	Staff see a live queue, open each application, verify documents, and move it through approval.
Approval workflows	Ready	Each loan type has its own approval path (e.g. Loan Officer → Credit → Branch Manager → Disbursement). You can adjust stages without new development.
Disbursement	Ready	Funds go to the customer's bank account on the application. Works with automated transfer or your existing manual process.
Loan book	Ready	Once disbursed, the loan appears in the system for staff and customer — amount, balance, and status.
Customer wallet	Later	Not needed for loan launch. Optional add-on for in-app funding and repayments.
Automated repayment schedules	Phase 2	Repayment terms are captured on every loan today. Detailed installment schedules and in-app collections can follow in the next release.

The customer journey — simple and seamless

From the customer's perspective, getting a loan feels straightforward:

What customers can do on the app (loans)

- See available loan products and what documents each one needs
- Start an application and save progress — come back later if needed

- Provide personal details, BVN, bank account for disbursement, and product-specific information (business, employment, school, or asset details)
- Upload photos and documents from their phone
- Submit when everything is complete
- Check where their application stands at any time
- View active loans after approval and disbursement

No wallet step. Customers never need to fund a wallet to apply for or receive a loan. Money goes straight to the bank account they provide on the application.

The admin journey — your team in control

Your operations, credit, and branch staff work from a dedicated admin portal:

What your team can do today

- **Application queue** — See all incoming applications, filter by status, and prioritize work
- **Full application view** — Every detail the customer submitted, plus guarantors, collateral, and documents
- **Document verification** — Mark documents as verified or request re-upload
- **Stage-by-stage approval** — Each role approves at their step; rejections are recorded with a reason
- **Set approved amount** — Final loan amount and repayment terms confirmed before disbursement
- **Disburse** — Release funds to the customer's account and close the application as disbursed
- **Audit trail** — Who viewed what, when decisions were made, and how long each stage took
- **Manage products** — Turn loan types on/off, adjust rates and fees, update required documents
- **Configure workflows** — Change approval steps per product as your process evolves

Default approval paths (you can change these)

Loan type	Approval steps
Business Loan	Document check → Credit assessment → Branch approval → Disbursement
Payday Loan	Document check → Credit check → Disbursement

Study Loan	Document check → Guardian & school verification → Branch approval → Disburse to school
Asset Loan	Document check → Asset review → Branch approval → Disbursement

Staff roles

Out of the box you have: **Loan Officer**, **Credit Analyst**, **Branch Manager**, and **Operations Officer**. Each sees only what their role allows — document checks, credit decisions, final approval, or disbursement.

Loan products available at launch

Product	Who it's for	Repayment style
GH Trust Business Loan	Established traders (3+ years in business)	Daily, weekly, or monthly
Payday Loan	Salary earners	Aligned to salary date (up to 120 days)
GH Trust Study Loan	Guardians financing study abroad	Monthly (up to 180 days)
Asset Loan	Customers financing assets	Monthly

LPO / Invoice Financing is reserved for a future release.

Each product already includes standard pricing (e.g. 3% processing fee, 8% monthly interest — adjustable by admin), required documents, and eligibility rules your credit team defined.

Why wallet integration is not blocking you

How loans work today

- Customer applies on the app
- Staff approve internally
- Money is sent to customer's **bank account**

What wallet would add (later)

- In-app account balance
- Fund wallet before fees
- Pay installments in-app

- Loan is recorded in the system

Most MFIs already disburse via bank transfer and track repayments operationally.

That is exactly how you can run from day one. Wallet integration becomes valuable when you want customers to pay entirely inside the app — but it is not a prerequisite for lending.

Repayment — what we capture now vs. what comes next

Product owners often ask about repayment plans. Here is a clear, practical answer:

At launch (Phase 1) — enough to operate

- Each product defines interest rate, processing fee, and allowed repayment frequency
- Customer selects how they want to repay when applying
- Admin confirms the final approved amount and terms before disbursement
- Operations continues tracking actual repayments using your existing tools (bank statements, Remita, spreadsheets) — same as today

Next release (Phase 2) — richer experience

- Automatic installment schedule generated when a loan is disbursed
- Customer sees upcoming due dates in the app
- Admin sees full repayment plan per loan
- Optional: automated collections (Remita, in-app payments)

Recommendation: Launch loans now with terms captured on every application. Add detailed repayment schedules and in-app collections as the next increment — not as a blocker to going live.

How repayment plans will be configured (when we add Phase 2)

We recommend keeping it simple for admins:

- **Per loan product** — set interest rate, allowed loan duration options, and repayment frequency (e.g. monthly only for Study, salary date for Payday)
- **System generates the schedule** — when a loan is disbursed, installments are calculated automatically
- **Exceptions only** — credit team can adjust a single loan manually when needed, not as the default

This gives you flexibility without overwhelming staff with complex setup on day one.

Applications vs. active loans — a quick note

An **application** is what the customer submits. An **active loan** only appears after your team approves and disburses. This is normal — the admin portal shows applications in the queue; the loan book shows what has actually been funded.

How to go live — three simple steps

1. **Deploy the platform** — Engineering hosts the backend, admin portal, and customer app in your staging or production environment (standard deployment — no wallet dependency).
2. **Configure your team** — Create staff accounts, assign roles (Loan Officer, Credit, Branch Manager, Operations), and confirm loan product settings match your credit policy.
3. **Start processing** — Customers apply on the app; your team reviews in the admin portal; disburse via bank transfer (automated or manual); loans appear in the book.

What to confirm before launch

- ☐ Which loan products to enable on day one (all four, or a phased rollout?)
- ☐ Final rates, fees, and document lists with credit team
- ☐ Approval steps match how branches actually work
- ☐ Disbursement: automated bank transfer or manual transfer + mark as disbursed in system
- ☐ Repayment tracking: continue with current ops process until Phase 2 schedules
- ☐ Staff training on admin portal (half-day walkthrough is sufficient)

What you can demo to stakeholders today

A full walkthrough is available in your test environment:

1. Log into the **admin portal** and open the applications queue
2. Pick an application — review documents, approve through each stage
3. Set the approved amount and disburse
4. Confirm the application shows as **Disbursed** and the loan appears in the loan book
5. On the customer side, the borrower sees their active loan in the app

This demonstrates a complete, working loan cycle — without any wallet step.

Decisions we need from product owners

Question	Suggested default
Launch loans without wallet?	Yes — recommended
Launch without auto repayment schedules?	Yes — ops tracks repayments; schedules in Phase 2
Which products on day one?	All four active products, or Business + Payday first
How to disburse at go-live?	Manual bank transfer + mark disbursed (fastest path) or automated transfer when rail is ready

Summary

The GH Trust loan platform is ready.

Customers can apply. Your team can review, approve, and disburse. Loans are recorded properly. Wallet and automated repayments are enhancements for later — not requirements for launch. Deploy now, train your team, and start lending.
